Topic and purpose

Iron District is a fictional gym in Cairo. This static website introduces three classes, shows a weekly timetable, compares two membership plans, and demonstrates a join form. It uses HTML5, CSS3, and local Bootstrap 5.3.3 CSS. There is no JavaScript, backend, database, or payment service.

Running the website

Open `index.html` in a browser. Bootstrap, the photograph, and the video are included locally, so the website works offline without installing anything. The four HTML pages share one custom stylesheet, `assets/style.css`.

Site map

Every page has the same navigation linking Home, Classes, Schedule, and Join us. The brand links to Home. Additional links connect the pages as follows:

- Home (`index.html`) links to Classes, Schedule, and Join.
- Classes (`classes.html`) links to Schedule through each class card.
- Schedule (`schedule.html`) links to Join through both membership cards.
- Join (`join.html`) returns to its demonstration note after a valid form submission.

Form demonstration

Join is a static demonstration. Use fictional details and a made-up password. The browser validates required fields, email syntax, a password of at least eight characters, and ages from 18 to 100. The message is optional.

Personal controls intentionally have IDs but no submission names: labels and validation work, but their values are not sent. The two membership radios share name="membership" and have values "start" and "build", so only one can be selected. A valid GET submission returns to `join.html?membership=start#form-note` or the Build equivalent. The note is always visible; it is not a registration receipt. No personal field values are sent, and no account or booking is created.

Sources and credits

- Gym photograph: Unsplash asset, included as `assets/images/gym.jpg`.
- Training video: Pexels video 3209241, included as `assets/video/training.mp4`.
- Framework: Bootstrap 5.3.3, included locally with its MIT license notice retained.
- Hosting: GitHub Pages, using GitHub's static deployment workflow to upload and publish the files without compilation.
- Gym name, classes, timetable and prices describe a fictional business.

Requirements checklist

Assignment item	Where it is used
Page structure and semantics	Every page has doctype, head, title, charset, viewport and description metadata, plus header, nav, main, section and footer. Class and membership cards are articles; Classes and Join use aside.
Text and links	Headings and paragraphs appear throughout. Home uses strong and em. Navigation and buttons link between pages; Classes has an external exercise information link.
Images, lists and media	Home has an image with alt text, an unordered benefits list, and a local video with controls and fallback link. Classes has an ordered beginner checklist.
Tables and merged cells	Schedule uses caption, thead, tbody and scoped headers. Sunday's heading has rowspan="2"; the arrival note has colspan="4".
Forms and validation	Join has text, email, password, number, date, radio, checkbox, select, textarea and submit controls. Labels match IDs. Required, minlength, min and max provide native validation.
External CSS, selectors and pseudo-classes	assets/style.css contains element, class, grouped and descendant selectors. Links use :hover and :focus-visible; buttons also use :focus-visible.
Colors, backgrounds, fonts and box model	The custom stylesheet sets cream and dark backgrounds, red accents, font families, sizes, line height, margins, padding and borders.
Positioning and display	Home's photo uses position: relative and its label uses position: absolute. Video uses display: block; navigation uses flex and membership plans use grid.
Flexbox and Grid	Custom .site-nav arranges and wraps navigation links. Custom .membership-grid creates two equal membership columns using 1fr 1fr and a gap.
Responsive design	The max-width: 767px media query stacks plans, gives the brand a separate row, reduces heading size and adjusts spacing. Bootstrap columns stack on smaller screens; table-responsive contains horizontal table scrolling.
Bootstrap	Local Bootstrap supplies container, row, col-md-6, col-md-4, g-4, align-items-center, cards, buttons, image sizing, table styling and form components. Custom CSS supplies additional design and required layout examples.

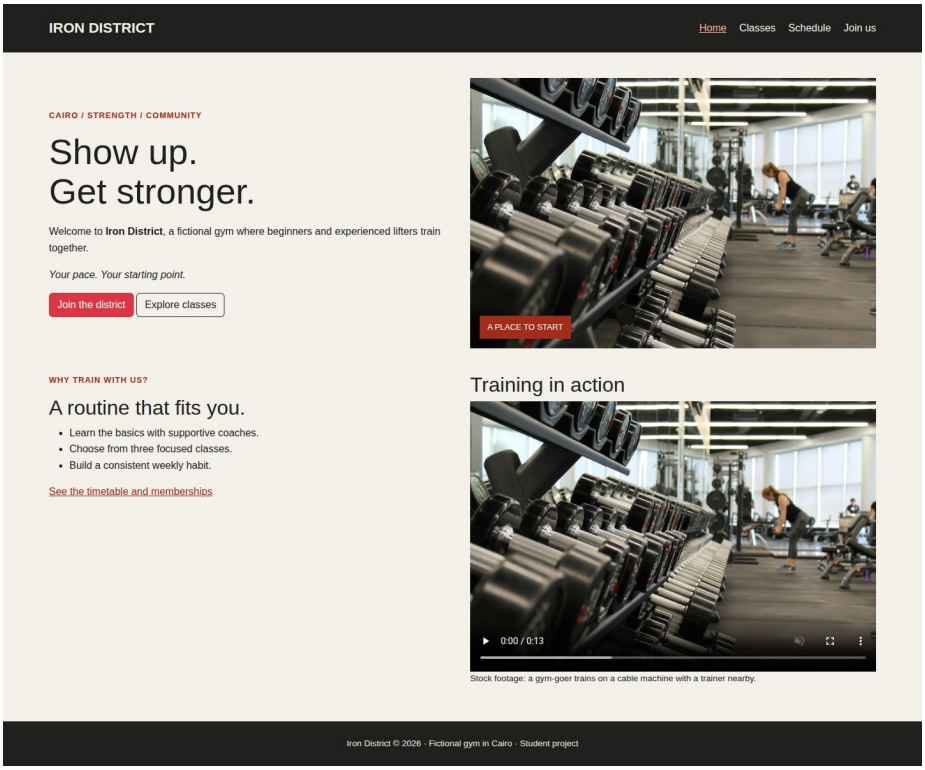

Verification

HTML5 parsing found no parser errors or duplicate IDs, and local file references resolve. Browser checks covered phone, tablet and desktop widths, with no page-wide horizontal overflow. The timetable scrolls inside its own container. Checks also covered navigation, active-page links, required fields, invalid email, a typed short password, age limits, radio exclusivity, valid submission, and local video playback. These are local Chromium-family checks, not a cross-browser certification.
